DETAILED ACTION

Page 2

Response to Remarks

1. Applicant's arguments with respect to claims 6-12 as filed on 6/07/05 have been carefully considered but are moot in view of the new grounds of rejection.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 6-7, 9-10, and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over ZIEGLER (Corporate Rearch & Development) in view of Borer (6,069,670) and Yamashita et al (5,347,599).

Regarding claims 6-7, ZIEGLER discloses a method for generating an image when estimating a motion of image sequences, the method comprising the steps of: determining a first motion vector with a pixel accuracy (Fig. 5, 1);

determining a second motion vector with a sub-pixel accuracy (2), wherein a resolution being selected to be higher (refined accuracy) than a resolution of a pixel raster in the first search;

determining a third motion vector by a further interpolation (3), wherein the resolution is increased once more, and the interpolation is carried out on the basis of a pixel raster.

ZIEGLER does not specifically disclose utilizing aliasing reducing interpolation filtering, and more than four neighboring pixels being utilized for an interpolation of each pixel.

Art Unit: 2613

However, Borer teaches motion vector detecting method comprising aliasing reducing interpolation filtering (col. 4, lines 8-25), and Yamashita et al teaches an adaptive interpolation method comprising a concept wherein more than four neighboring pixels being utilized for an interpolation of each pixel (col. 4, lines 33-49).

Therefore, it would have been obvious to a person of ordinary skill in the relevant art employing a method for generating an image when estimating a motion of image sequences as taught by ZIEGLER to incorporate the concepts as discussed above as taught by Borer and Yamashita et al so as to reduce the unwanted aliasing by utilizing the Borer's interpolation filter, and to utilize more than four neighboring pixels for an interpolation of each pixel, thereby preventing image deterioration and improving interpolation performance near vertical and horizontal directions.

Regarding claims 9 and 10, the Examiner takes official notice that FIR filter is well known in the art, including mathematics, for estimating a value of a particular pixel at a certain frame. Therefore, it is considered a design choice by an user to use filter coefficients such as 0, ½, -43/256, 23/256, or -8/256 in order to have a better results, such as reducing the aliasing effect.

Regarding claim 12, the Examiner takes official notice that a conventional encoder comprises of encoding (inter frame) of a motion vector for transmission, and a range of values of motion vector difference (motion estimation/compensation) to be coded to an increased/decreased resolution depending on the application, practical usage, and available bandwidth.

Therefore, it would have been obvious to a person of ordinary skill in the relevant art employing a method for generating an image when estimating a motion of image sequences as taught by ZIEGLER to encode the motion vectors including motion vector differences for increased/decreased resolution depending on the application, practical usage, and available bandwidth.

4. Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over ZIEGLER, Borer, and Yamashita et al as applied to claim 6 above, and further in view of Nakaya et al (5,684,538).

Application/Control Number: 09/462,863 Page 4

Art Unit: 2613

Regarding claim 8, the combination of ZIEGLER, Borer, and Yamashita et al does not particularly disclose more neighboring pixels being utilized for a bilinear interpolation.

However, Nakaya et al teaches utilizing bilinear interpolation as an interpolation process using four pixels around the interpolation point (col. 2, lines 41-47).

Therefore, it would have been obvious to a person of ordinary skill in the relevant art employing a method for generating an image when estimating a motion of image sequences as taught by ZIEGLER to incorporate the concept as taught by the Nakaya et al so that more neighboring pixels are utilized for a bilinear interpolation, thereby preventing image deterioration and improving interpolation performance near vertical and horizontal directions.

5. Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over ZIEGLER, Borer, and Yamashita et al as applied to claim 6 above, and further in view of Eifrig et al (5,991,447).

Regarding claim 11, the combination of ZIEGLER, Thomas, and Yamashita et al does not particularly disclose predicting video objects separately, and inserting coefficients into a transmission bit stream at a beginning.

However, Eifrig et al teaches predicting video objects separately (Abs.), and inserting coefficients into a transmission bit stream (140) at a beginning in order to achieve efficient coding, object scalability, spatial and temporal scalability, and less error.

Therefore, it would have been obvious to a person of ordinary skill in the relevant art employing a method for generating an image when estimating a motion of image sequences as taught by ZIEGLER to incorporate the well known concept of predicting video objects separately, and inserting coefficients into a transmission bit stream at a beginning as taught by Eifrig et al in order to achieve efficient coding, object scalability, spatial and temporal scalability, and less error.

Application/Control Number: 09/462,863 Page 5

Art Unit: 2613

Conclusion

6. The prior art made of record is considered pertinent to Applicant's disclosure.

A) Kim et al (5,541,660), Systolic realization of motion compensated interpolation filter.
